

MINIMAL INTERVENTION, MAXIMAL OUTCOMES

Improving Esthetics and Function

Are you ready to increase your understanding of **minimally invasive dentistry** and achieve **predictable esthetic** and **functional** results?

It's very easy to talk about taking away less tooth structure, but it is more difficult to apply this concept. Combining old school concepts with new school technology, Dr. Volker (*a Diplomate in the World Congress of Minimally Invasive Dentistry*) presents a unifying approach which includes proportional analyses, orthodontic techniques, and direct/indirect restorations. Additionally, the importance of uncommon – yet proven - restorative techniques such as transitional composite restorations and marginal refinement techniques will be covered.

This course aims to give clinicians the tools needed to successfully and immediately expand the use of minimally-invasive dentistry in daily practice.

Course Objectives

- Understand and apply principles of smile design and analysis of proportions
- Gain familiarity with several minimally-invasive direct and indirect restorative treatments, techniques and materials
- Learn how to best utilize transitional composite restorations
- Understand and implement marginal refinement techniques for indirect restorations
- Gain familiarity with orthodontic options, including treatment for periodontally compromised patients
- Understand how to apply the protocol of combining orthodontics and restorative modalities for esthetic improvement while minimizing tooth reduction
